Agenda

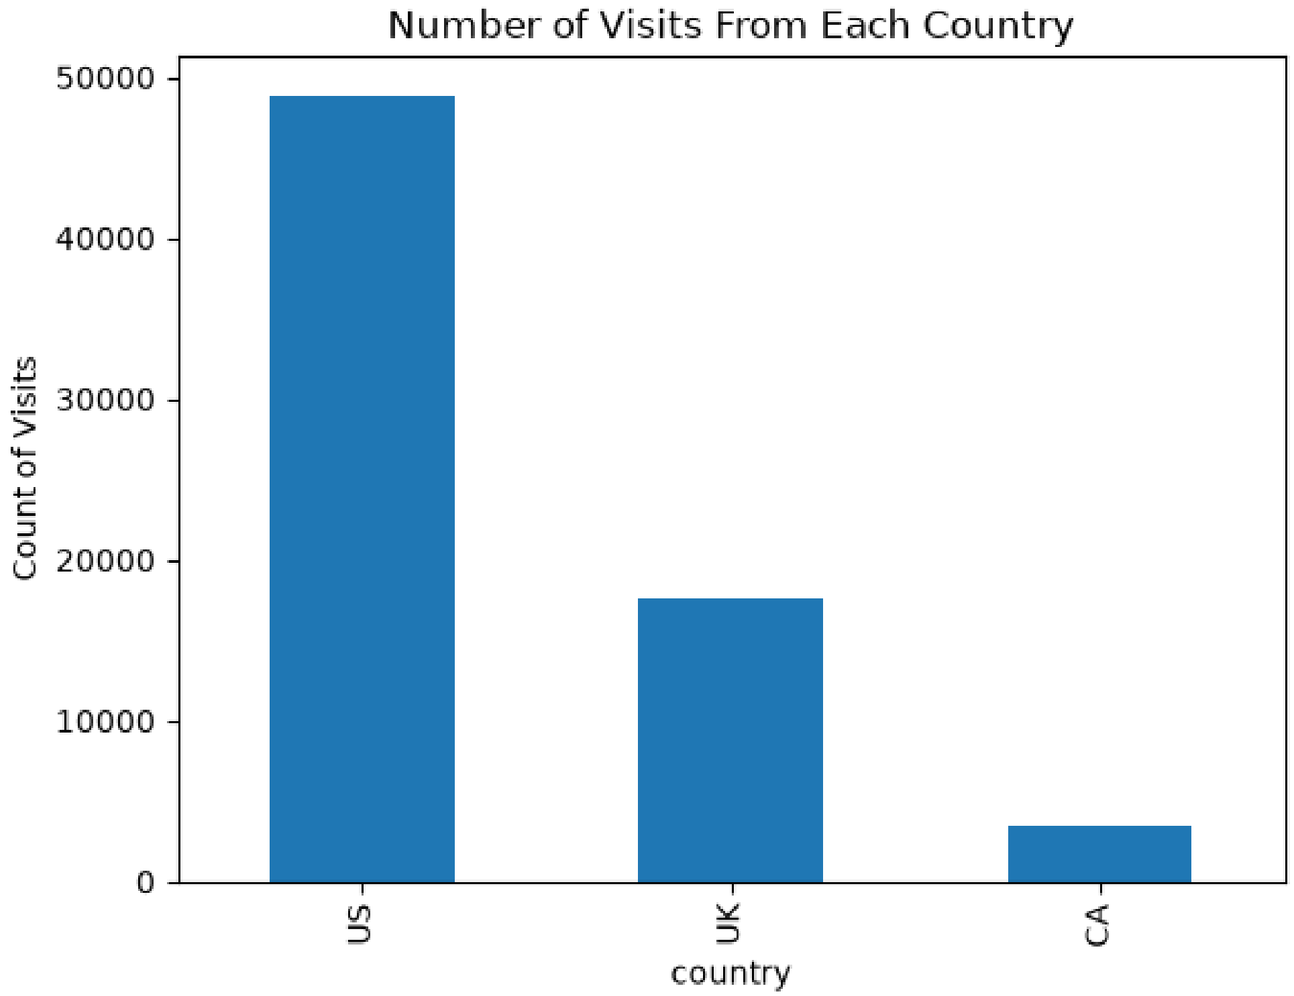

Findings of A/B test analysis

- Experiment Setup
- Conversion Rates
- Experiment Results

How Was the Experiment Implemented?

Total Variant Visitors: 35,211

Total Control Participants: 34,678

Conversion Rates

	U.S.	U.K.	CA
Control	10.7%	10.2%	9.4%
Treatment	15.8%	14.9%	15.4%

Executive Summary: The treatment effect is consistent across all three countries - in every market, the treatment page outperforms control by roughly 5-6 percentage points. There is no meaningful interaction between country and group, so the treatment appears universally effective.

Experiment Results

- Treatment Conversion Rate: 15.5%
- Control Conversion Rate: 10.5%
- Delta in Treatment vs. Control Conversion Rate: +5.0 percentage points (0.0501)
- p-value: 0.0000
- Conclusion:
    - The p-value of 0.0000 is well below the significance threshold of α = 0.05, so we **reject the null hypothesis**. There is statistically significant evidence that the treatment and control pages convert at different rates. Because the treatment page converts users at a rate roughly 5 percentage points higher than the control page - and this gap is consistent across all three markets (US, UK, and CA) - the data supports **implementing the new page** company-wide.
